Table 2: The entries in this table are coefficients. For each outcome variable, we have 2 rows - one is a "full" model, and one is a "subsetting" model. When performing the model averaging, the full one treats variables missing from the model as 0's, whereas the subset model averages coefficients only where that variable appears.

Breakpoint Analysis

Model Selection

We have also generated this analysis when breaking up the data into 3 or more tiers, but they do not appear to show the differences as clearly as the two-tier models. We conjecture that if as we increase the number of tiers by which we factorize the data, there is a higher proportion of zeros in the resulting lowest tier. This causes heightened sensitivity in the signal of the data and deems the plot uninterpretable.

More Plots

The Aggregated M&A variable is divided by 8 for scaling purposes. Breakpoint is the pivot point between the two tiers.

	TopTier	BottomTier	AggM&A	Breakpoints
TopTier	1	0.782774843274932	0.946799173814814	0.480962466373272
