Table 2: The entries in this table are coefficients. For each outcome variable, we have 2 rows - one is a "full" model, and one is a "subsetted" model. When performing the model averaging, the full one treats variables missing from the model as 0's, whereas the subset model averages coefficients only where that variable appears.

Breakpoint Analysis

M&A Coefficients From 1988 To 2016 (Im-GrossRev)

Model Selection

(a)

(b)

(c)

(d)

We have also generated this analysis when breaking up the data into 3 or more tiers, but they do not appear to show the differences as clearly as the two-tier models. We conjecture that if as we increase the number of tiers by which we factorize the data, there is a higher proportion of zeros in the resulting lowest tier. This causes heightened sensitivity in the signal of the data and deems the plot uninterpretable.

More Plots

The Aggregated M&A variable is divided by 8 for scaling purposes. Breakpoint is the pivot point between the two tiers.

	TopTier	BottomTier	AggM&A	Breakpoints
